

Seasonal Demand Calendar - Export and Local

Document MKT-SEA-01 | Type: seasonal_calendar | Effective: 2026-01-05

Export shipping windows

Export demand is shaped by the retail calendar in the destination market rather than by local seasons. The windows that move volume are:

Northern hemisphere spring and summer programmes ship February to April. Back-to-school and autumn programmes ship July to September. Holiday and year-end programmes ship September to November, and this is the single largest window of the year across all accounts.

January and February are the quietest export months. A dip in a January forecast is a calendar effect and recurs every year.

Local and regional demand

Regional demand follows festival and school calendars. The April new year period lifts casual wear and t-shirts, particularly GAR-002 and GAR-005, in the four weeks before the holiday. The December season lifts formal shirts and gifting categories.

Factory output also falls during the April holiday week itself, so a capacity plan that assumes a full April is optimistic by roughly five working days.

Category seasonality summary

Category	Peak months	Trough months
Polo and t-shirt basics	May to June, October to November	January to February
Formal shirts	August to October, December	May to July
Fleece and hoodies	June to August placement, ships September to November	January to March
Sportswear	Steady year round, mild lift in March and September	None pronounced
Denim	September to November	February to April

Reading a forecast against this calendar

A trend line fitted to twelve months of history carries these seasonal movements inside it. Where a forecast increase or decrease lines up with a window in this calendar, the movement is expected and the recommendation should say so rather than flagging it as a change in the underlying trend.
